SUMMARY

Fruit Prices to Remain Strong

Major weather disturbances and strong demand during the past 2 years continue to push fruit prices higher. Prices are expected to stay high through 1979. Stocks of nearly all canned, frozen, and dried noncitrus fruits are sharply below last year's levels. This year's citrus crop is expected to be 7 percent below the 1977/78 output, because freezes in California and Texas further reduced orange and grapefruit crops which were already forecast below last year's levels.

The February 1979 index of prices received by growers for fresh and processed fruit stood at 227 (1967=100), 16 percent above year-earlier levels but below the record high of 279 reached in September 1978. Moderately to substantially higher prices were recorded for all fruits.

Reflecting strong grower prices, the consumer price index for fresh fruit, as reported by the Bureau of Labor Statistics (BLS), stood at 209.1 (1967=100) in January 1979, 11 percent above the 1978 level. Reduced citrus supplies and strong demand will keep retail prices for fresh fruit moderately higher than last year despite the larger supplies of fresh apples.

U.S. orange crop prospects on February 1 totaled about 205 million boxes, about 7 percent less than the 1977/78 total. Crops were estimated to be smaller in all producing areas. Even with the smaller orange crop, shipments of Florida oranges for fresh sales were moderately above year-earlier levels, but shipments from California lagged behind last year's pace.

Florida citrus packers have processed moderately more frozen concentrated orange juice this year than last. Much of the freeze-damaged fruit in California, Arizona, and Texas was salvaged by processing. Current indications point to supplies of FCOJ being moderately larger this year as a result of a larger carryover, larger pack, and increased imports from Brazil. Reflecting the smaller crop and good demand in both the fresh and processing markets, prices for both fresh and processing oranges have averaged substantially to sharply above last season's levels.

U.S. grapefruit production is forecast at 67.4 million boxes, 9 percent below the 1977/78 level. Smaller production is expected in all producing areas. Movement of grapefruit for fresh sales in

both domestic and export channels so far this season has been running substantially ahead of last season's pace. As a result of the smaller crop and good processor demand, f.o.b. prices for fresh Florida grapefruit have been averaging moderately to sharply above year-earlier levels, depending on the variety. Prices are expected to remain above last year's levels for the balance of the season.

February 1 prospects for lemon production point to a substantially smaller crop. California's crop, at 15 million boxes, is 26 percent below the 1977/78 level; the Arizona crop, at 6.3 million boxes, is 11 percent larger. Total utilization of lemons through mid-February was slightly below year-earlier levels. Substantially fewer lemons were processed, but fresh sales were up as larger shipments abroad more than offset smaller domestic movement. As a result of the smaller crop and strong foreign demand, f.o.b. prices for fresh lemons have averaged almost 30 percent above last year's high levels, and are likely to remain high through the remainder of the season.

Storage stocks of fresh apples at the beginning of February totaled 2.1 billion pounds, up a quarter from a year earlier. Despite larger remaining supplies of apples, neither grower nor retail prices are expected to decline appreciably. The U.S. average grower price in February, at 14.0 cents per pound, was up moderately from the February 1978 level, and apple prices increase seasonally as controlled atmosphere storage apples come on the market.

Supplies of canned noncitrus fruit on January 1 were substantially below those of a year ago as a result of a 9-percent smaller carryin and an 18-percent smaller pack. Overall shipments of canned fruit through December 1 were running generally behind a year earlier. F.o.b. prices for the individual canned fruits have reflected the supply situation. Current stocks of most dried fruit, particularly raisins and prunes, are also smaller because of the September rains and the resulting smaller packs. Cold storage holdings of frozen fruits and berries were also substantially lower than a year earlier.

Estimated production of the six major domestic tree nuts in 1978, at 430 thousand tons, was down almost one-fourth from the 1977 crop, as smaller crops of almonds, walnuts, pecans, and pistachios more than offset larger crops of filberts and Macadamia nuts. As a result of the smaller supplies, prices for all domestic tree nuts are at or near record-high levels. The total value of utilized tree nut production is estimated at $621 million, up 12 percent from 1977.

The utilized production of all fruits, berries, and tree nuts declined to 26.6 million tons in 1978, down slightly from a year earlier. But, due to higher farm prices, the total value of production jumped 20 percent, to $5.3 billion. Citrus fruits accounted for 54 percent of the total tonnage harvested but only about 30 percent of the total value of all fruits and nuts.

Note: In this report
Slightly = 0.1 to 2.99 percent
Moderately = 3.0 to 6.99 percent
Substantially = 7.0 to 18.99 percent
Sharply = 19.0 percent and above

RECENT DEVELOPMENTS AND OUTLOOK

GENERAL PRICE OUTLOOK

The February 1979 index of prices received by growers for fresh and processed fruit stood at 227 (1967=100), 16 percent above a year earlier. Moderately to sharply higher prices were reported for all fruits. In addition, December freezes in California and Texas, combined with good demand, have contributed to sharply higher prices of citrus, particularly oranges and lemons.

Although cold storage stocks of apples and pears at the beginning of February were considerably larger than a year ago, prices are not likely to decline. Thus, combined with smaller supplies of citrus, the index of prices received by growers during the first half of 1979 is expected to remain substantially above year-earlier levels.

Source: Bureau of Labor Statistics.

With higher prices to growers, the index of consumer prices for fresh fruit, as measured by the Bureau of Labor Statistics (BLS) stood at 209.1 (1967=100) in January 1979, 11 percent above 1978. Reduced supplies of citrus for fresh market along with increased marketing costs are expected to keep retail prices during the first half of 1979 substantially higher than a year ago.

Wholesale prices of canned fruit continued to advance during the last half of 1978, because of higher contract prices associated with smaller crops for most noncitrus and higher processing costs. By January 1979, the BLS wholesale price index reached 209.3 (1967=100), 14 percent above year-earlier levels. Demand for canned noncitrus fruit, particularly in the export market, was strong. Wholesale prices of canned fruit are expected to remain strong through the balance of the season.

Higher prices for all canned fruit juices, particularly orange, pushed the January wholesale canned fruit-juice index almost 15 percent above a year earlier. Wholesale price indexes of both frozen fruit and juice reached record high levels in January 1979. Due to the sharply reduced pack of raisins and dried prunes , the wholesale price index of dried fruit steadily advanced to 579.3 (1967=100) in January 1979, slightly more than double year-earlier levels.

CITRUS

On February 1, prospects pointed to a citrus crop of 13.1 million tons (11.9 million metric tons), 2 percent below the January 1 forecast and 7 percent below the 1977/78 season.

The subfreezing temperatures in Texas on January 2 and 3 froze some oranges and grapefruit. Fruit suffered extensive damage, and droppage and leaf defoliation were widespread. The February 1 estimates of the California and Arizona lemon crops remained unchanged from the January 1 forecasts which have reflected the December freeze damage. However, estimate of the California tangerine crop, damaged by both the December and January freezes, continued to decline in January. The December and January freezes also resulted in Arizona lemon crop estimates 10 percent smaller than the January 1 forecast. However, Florida citrus groves are in excellent condition. Citrus prices have been moderately to substantially higher than a year earlier.

Oranges

Moderately Smaller Crop

The 1978/79 U.S. orange crop was forecast at 205 million boxes (8.11 million metric tons), 7 percent less than last season, with smaller production estimated for all producing States. The subfreezing temperatures in December and January caused considerable damage in California, Arizona, and Texas. However, the output of early, midseason, and Navel varieties, which account for more than half of the crop, was still expected to be slightly larger. The Valencia orange crop was estimated at 89.3 million boxes, 16 percent smaller than last season.

Florida's orange crop was forecast at 163 million boxes, a decrease of 3 percent from last season. The early and midseason crops were expected to total 93 million boxes, 5 percent more than last season's harvest. The Valencia crop was 12 percent smaller.

The California forecast, at 33 million boxes, was 21 percent below last season. The Navel crop, at 18 million boxes, was down 10 percent, and the Valencia crop was 32 percent smaller. The early December freeze in California reduced the quantity of oranges substantially and also caused a shift in utilization from fresh market to processing. Consequently, the supply of quality oranges available for fresh market is substantially reduced.

Texas orange prospects on February 1, at 5.7 million boxes, were 10 percent below the January 1 estimates because of freezing temperatures on Jan-

[1] The crop year begins with bloom of the first year shown and ends with completion of harvest the following year. [2] Net content of box varies. Approximate averages are as follows: Oranges-California and Arizona, 75 lbs.; Florida, 90 lbs.; Texas, 85 lbs.; Grapefruit-California, Desert Valleys, and Arizona, 64 lbs.; other California areas, 67 lbs.; Florida, 85 lbs.; Texas, 80 lbs.; Lemons, 76 lbs.; Limes, 80 lbs.; Tangelos, 90 lbs.; Tangerines-California and Arizona, 75 lbs.; Florida, 95 lbs.; and Temples 90 lbs. [3] Navel and miscellaneous varieties in California and Arizona. Early and midseason varieties in Florida and Texas, including small quantities of tangerines in Texas.

Sources: Crop Production, CRB, ESCS, and Florida Crop and Livestock Reporting Service.

uary 2 and 3. The crop was estimated to be 7 percent below the 1977/78 total. Fruit suffered extensive damage and fruit droppage was widespread. The Arizona orange crop was placed at 3.4 million boxes, 9 percent below the 1977/78 season.

Historical trend data for bearing acreage, production, and yield per acre for U.S. oranges and by States from 1959/60 to 1977/78 are shown in figure 1. Bearing acreage of Florida oranges has continued its downward trend since 1970/71 when it reached a record 660,500 acres. However, yields in 1977/78 were the third highest on record. California orange bearing acreage has also declined. Consequently, the U.S. orange bearing acreage in 1977/78 was the smallest in 9 years.

USDA

NEG. ERCS 156-79 (2)

Market Prospects and Prices

Even with a smaller orange crop, shipments of Florida oranges for fresh sales so far this season were moderately above year-earlier levels. Both domestic and foreign shipments were larger. The reduced available supplies of oranges for fresh market from other producing areas strengthened demand for Florida oranges. In addition, Florida citrus packers are also bidding aggressively for these oranges. In mid-February, f.o.b. prices for Florida early and midseason oranges were quoted at $5.00 a carton (4/5 bushel), compared with $4.51 a year earlier. With a smaller Valencia crop in prospect, Florida orange prices for fresh use are expected to remain substantially above year-earlier levels through the season.

Florida's delivered-in prices for early and midseason processing oranges have averaged substantially to sharply above year-earlier levels. In mid-February, delivered-in prices for oranges for processing frozen concentrated orange juice averaged $6.56 a box compared with $5.13 a year ago. Despite higher prices, consumer demand for processed orange products is still strong. Thus, the smaller Valencia crop and good demand will keep orange prices at levels substantially higher than last season.

Shipments of Navel oranges for fresh use from California and Arizona through early February have lagged moderately behind a year ago. However, deliveries to processors have been ahead of a year ago. As a result of the freezes, there has been some tradeoff in the utilization of Navel oranges between the fresh market and processing outlets. With smaller availability of quality oranges for fresh market, f.o.b. prices for fresh California-Arizona Navels have averaged sharply higher than a year ago. In mid-February, prices were quoted at $7.13 a carton, compared with $5.58 last year. In view of the sharply smaller supplies of Navel oranges remaining for harvest, the shipping season is expected to end early. The season-average price is expected to be sharply higher.

With the smaller crop and less competition from other producing areas, Texas f.o.b. prices for oranges for both fresh sales and processing have also averaged considerably higher.

Larger Supplies of Frozen Concentrated Orange Juice Expected

Although this season's combined output of Florida oranges and Temples is forecast to be smaller than last season, a higher juice yield will result in a larger pack of frozen concentrated orange juice (FCOJ). The Florida all orange juice yield for the 1978/79 crop is projected at 1.32 gallons of 45 degree brix concentrate per box, compared with 1.23 gallons per box for the 1977/78 crop. In addition, domestic pack from other producing areas is

Figure 1

expected to be up as freeze-damaged oranges from Texas, California, and Arizona have been salvaged by processing. Thus, combined with the larger carryover and heavy imports from Brazil, the total supply of FCOJ during the 1978/79 season will be moderately larger than in 1977/78.

Florida packers had processed 66.4 million gallons of FCOJ (excluding reprocessed) through February 10, an increase of 6 percent from last season. Despite higher prices, total product movement so far this season was moderately ahead of last season's pace. Canner list prices of FCOJ have been steady at $3.55 to $3.60 per dozen 6-ounce cans (unadvertised brands, Florida canneries), compared with $3.30 a year ago. The larger carryover and pack more than offset larger movement, leaving the total stocks-on-hand of FCOJ as of February 10, almost 45 percent larger than a year earlier. Thus, if movement remains at the current pace, f.o.b. prices are expected to remain relatively steady.

Considerably Larger Movement of Chilled Orange Juice

Florida's packers processed 42.0 million gallons of chilled orange juice from fresh fruit through February 10, down 4 percent from last season. However, because of the sharp increase in pack from frozen concentrated orange juice, the net pack of chilled orange juice totaled 68.2 million gallons, an increase of 15 percent from last season. Despite higher prices, movement of chilled orange juice continued at high levels. Domestic movement increased 14 percent through February 10, while export shipments were one-fifth larger. With the carryin at the beginning of the season almost the same as a year ago, the larger movement more than offset larger pack, leaving the stocks-on-hand slightly smaller than last season.

Moderately Larger Supplies of Canned Orange Juice

Through February 10, Florida citrus packers processed 6.4 million cases (24/2's) of canned orange juice, an increase of 14 percent from the corresponding period a year ago. The canned orange juice pack in Texas so far this season is running a third above year-earlier levels as juice processors operate at full capacity in order to salvage fruit. Despite higher prices, movement so far this season was up 7 percent. Florida packers raised the prices for canned single-strength orange juice from $7.75 per case (12/46 ounces) to $8.00 at the beginning of 1979. This compares with $7.00 a year ago. Because of the substantial increase in pack, the stocks-on-hand as of February 10 were 13 percent above year-earlier levels.

Export Prospects

Shipments abroad of fresh oranges from Florida have shown sharp increases from last season, but exports from California were up only slightly. Larger purchases by Hong Kong and Japan were chiefly responsible for the increase. Canada, our largest customer, purchased moderately less than a year ago. Larger purchases from Japan are attributed to the 1977 agreement to increase its import quota of U.S. oranges. The increases should continue since the recent agreement with Japan calls for further increase in shipments of U.S. oranges into Japan from 45,000 metric tons in 1977 to 82,000 metric tons by 1983.

Grapefruit

Smaller Crop Expected

The February 1 forecast for the 1978/79 U.S. grapefruit crop at 67.4 million boxes (2.5 million metric tons), was 9 percent below last season. Smaller production was estimated for all producing areas.

The Florida grapefruit crop was expected to total 50 million boxes, 3 percent smaller than last season. The Texas crop, at 9 million boxes, was 24 percent less than a year earlier. The early January freeze damaged Texas fruit extensively. The California grapefruit crop was forecast one-fifth less than last season, and grapefruit production in Arizona was 17 percent smaller.

U.S. grapefruit harvest was 39 percent complete on February 1 compared with 31 percent on the same date last year. Picking in Florida was 39 percent complete compared with 35 percent a year ago. Because of the freezes in Texas and Arizona, harvest has been considerably ahead of last year's pace with 57 and 30 percent complete, respectively. As a result, the crop remaining for harvest is substantially less than a year earlier.

Market Outlook

The movement of Florida grapefruit to both fresh market and processing outlets has been running substantially ahead of last season's pace. As a result of sharply smaller carryover stocks of canned grapefruit juice, Florida canners have been actively bidding for grapefruit since the beginning of the season. Through February 18, 13.9 million boxes of grapefruit had been delivered to processors, an increase of 12 percent from last season. Shipments of fresh grapefruit for export markets are particularly strong. Exports to Japan, our primary market, showed a sharp increase from last season. The depreciation of the U.S. dollar against the Japanese yen probably contributed to the increase to some extent. However, demand from Canadian and European markets has weak-

ened substantially from last season as consumers probably substitute the abundant and less expensive fresh apples and pears in their diets.

As a result of the smaller crop and good processor demand, f.o.b. prices for Florida fresh grapefruit are averaging moderately to sharply above year-earlier levels depending on variety. Prices advanced substantially after the January freeze in Texas. By mid-February, f.o.b. prices for Indian River pink seedless grapefruit were quoted at $3.90 per 4/5 bushel box, compared with $3.53 a year earlier. Likewise, the delivered-in prices for Florida grapefruit for processing use have also averaged moderately to substantially higher than last season. Since the remaining supplies are substantially smaller than a year ago, grapefruit prices are expected to remain above last year for the balance of the season.

F.o.b. prices for Texas grapefruit for fresh market moved up sharply after the January freeze. By mid-February, f.o.b. prices were quoted at $3.53 per box of 7/10 bushel compared with $2.90 a year earlier. Thus, f.o.b. prices so far this season have averaged moderately above last season.

Sharply Larger Grapefruit Juice Pack

The Florida citrus packers have processed 7.6 million cases (24/2's) of canned grapefruit juice through February 10, an increase of 28 percent from a year earlier. Despite considerably higher prices, demand has been good. Movement through February 10 was only slightly less than last season. Thus, the larger pack has caused the stocks-on-hand, as of February 10, to be 16 percent above year-earlier levels. The current canner price for canned grapefruit juice is quoted at $6.00 per dozen (46-ounce can, Florida canneries), compared with $5.25 a year ago. If the movement remains at the current pace, prices are not likely to advance.

The net pack of Florida frozen concentrated grapefruit juice through February 10 also has been running sharply ahead of last season's pace. Thus, the larger pack plus the larger carryin more than offset the larger movement, leaving the stocks-on-hand as of February 10 one-fourth more than a year earlier. F.o.b. prices remained steady at $2.60 per dozen (6-ounce can, Florida canneries) until February 10 when they were raised to $2.80, compared with $2.40 a year ago. In view of the sharply larger stocks, prices are likely to stabilize at the current levels.

In contrast, the total pack of Florida chilled grapefruit juice (excluding single-strength reprocessed) through February 10 was substantially smaller than last season. However, movement has been a tenth above last season in spite of higher prices. Thus, with the smaller pack and carryin, the stocks-on-hand as of February 10 were approximately one-half of last year's quantity.

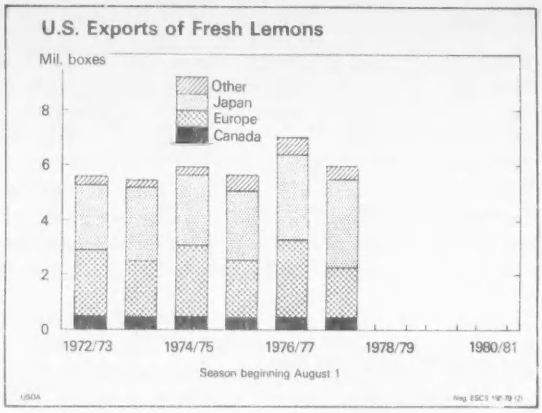
YEAR BEGINNING DECEMBER

Lemons

As of February 1, the 1978/79 U.S. lemon production was forecast at 21.3 million boxes (734 thousand metric tons), 18 percent below last season. The crop in California, at 15 million boxes, was 26 percent below 1977/78. The Arizona crop, at 6.30 million boxes, was 10 percent below the January 1 forecast as a result of damage from low temperatures but was still 11 percent above last season.

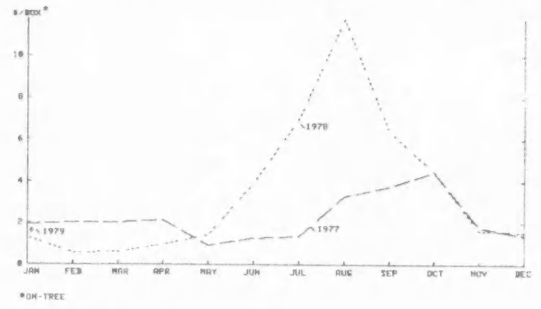
Harvest of lemons in California was 38 percent complete by February 1 compared with 30 percent



last year. As a result of the December and January freezes, Central Valley lemons show some tree damage and fruit is experiencing some dryness. Coastal lemons have been hit very hard with large amounts of defoliation. Harvest of Arizona lemons was more than 70 percent complete by February 1.

Total utilization of lemons through mid-February was moderately below year-earlier levels because of smaller shipments of lemons to processors. Shipments of lemons for fresh sale were up substantially as large shipments abroad more than offset smaller domestic movement. The export market appears very bright, particularly Europe, as the 1978/79 lemon crops in Italy and Spain are currently forecast sharply smaller than 1977/78. Hot winds during fruit setting and subnormal precipitation during much of the season dropped the Italian lemon crop one-fourth from last season. The Spanish lemon crop is likely to be down 24 percent due mainly to defective flowering as a result of low temperatures in February and March. Through December, our exports to Europe this season have

ALL LEMONS: U.S. AVERAGE PRICE RECEIVED BY GROWER



*ON-TREE

been up 53 percent from the same period a year ago. Our shipments to Japan continue to surge, 27 percent above last season. The appreciation of the Japanese yen relative to the U.S. dollar will help hold our exports of lemons to Japan above last year's levels.

As a result of the smaller crop and good foreign demand, f.o.b. prices for fresh lemons have averaged almost 30 percent above last year's high levels. In mid-February, f.o.b. prices for fresh lemons for domestic sales were quoted at $6.61 per carton (38 pounds net), compared with $5.75 a year ago. In view of good demand, prices are likely to remain above year-earlier levels.

Other Citrus

The 1978/79 Temple crop in Florida was forecast at 4.8 million boxes (196 thousand metric tons), 2 percent below last season. The crop was 27 percent harvested by February 1 compared with 31 percent on the same date last year. Through mid-February, total shipment was substantially behind last season's pace with fresh sale down 6 percent and processing use down one-fourth. F.o.b. prices have declined with increasing supplies. By mid-February, f.o.b. prices were quoted at $5.25 per carton (4/5 bushel), 5 percent more than the corresponding period a year ago. F.o.b. prices so far this season have averaged one-tenth higher than last season.

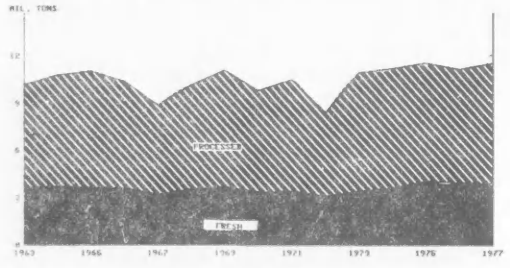
As of February 1, the U.S. tangerine crop was expected to total 5.4 million boxes (217 thousand metric tons), 9 percent below the January 1 forecast, but the same as last season. Utilization of the Florida crop is expected to reach 3.6 million boxes, 300 thousand boxes less than the estimated production of size 210 or larger fruit. Because of the December freeze, the California crop continued to decline and is now expected to total 1.25 million boxes, 17 percent below last season. Likewise, the Arizona crop, damaged by the December freeze, was forecast at 550 thousand boxes, down 100 thousand boxes from January and 21 percent below last season. Utilization of tangerines in Florida for both fresh sales and processing outlets so far this season has been one-fifth above last season. Since mid-December, f.o.b. prices have been steadily declining to levels below a year ago. The season-average price is currently estimated at $5.82 per carton (4/5 bushel) compared with $5.87 last season.

Florida's tangelo crop for 1978/79 was forecast at 4 million boxes (163 thousand metric tons), 18 percent below last season. As of February 1, harvest was 95 percent complete. Because of the smaller crop, utilization of tangelos has been sharply reduced from last season's levels with both fresh sales and processing outlets down almost 15 percent. Consequently, f.o.b. prices for tangelos averaged $4.90 a carton (4/5 bushel), up one-fifth from last season.

FRESH NONCITRUS

Production of noncitrus fruits and berries in 1978 totaled 11.9 million tons, slightly more than a year earlier and 4 percent larger than in 1976. A larger apple crop was primarily responsible for the higher total. The largest tonnage increases occurred in apples, bushberries, sweet cherries, cranberries, olives, and papayas. Decreases occurred in the major California crops—apricots, dates, figs, grapes, nectarines, peaches, pears, plums and prunes, and strawberries. Tart cherry production in Michigan was also lower than in 1977. Total bearing acreage of noncitrus fruits (including strawberries) continued to expand, increasing 1 percent in 1978.

NONCITRUS FRUIT: PRODUCTION AND UTILIZATION



The value of utilized production of 18 major deciduous fruits (excluding avocados and persimmons), at $3.1 billion, was 19 percent higher than the year earlier. The value of each of the fruits was greater than the year before, even though production of some was down, because prices in both the fresh and processing markets were at high levels throughout the 1978 season.

Apples

Record Crop

The 1978 commercial apple crop increased for the third year in a row to a new record 7.55 billion pounds, 6 percent larger than the previous record set in 1975. Of the total, 7.53 billion pounds were utilized. The utilized crop was 13 percent larger than in 1977 and 16 percent larger than in 1976. In the East, 3.07 billion pounds were utilized, 14 percent more than a year ago, while utilization in the Central States increased 26 percent, to 1.27 billion pounds. The utilized crop in the West, at 3.2 billion pounds, was up 8 percent from a year earlier. In Washington, the Nation's leading producer, the 2.3-billion-pound crop was 10 percent above last season and only slightly below the 1976 record crop.

Usual utilization patterns for apples are shown in the accompanying pie chart. Well over half of the total apple crop is consumed in the fresh form. Of the remainder, canned apples and apple juice-cider are the major processed products. Frozen, dried and "other" uses usually account for about 5 percent of the utilized crop.

The Nation's leading varieties of apples were: Red Delicious, 36 percent of the total; Golden Delicious, 17 percent; MacIntosh, 10 percent; Rome Beauty, 7 percent; and Jonathan and York Imperial, each 5 percent of the total.

Several varieties showed substantial gains in production. Production of Rhode Island Greenings increased 35 percent over 1977. York Imperial production increased 33 percent. Other varieties showing gains were: Rome Beauty, up 19 percent;

Red Delicious, 17 percent; Winesap, 12 percent; and Stayman, 10 percent.

Remaining Supplies Up Sharply

Supplies of apples in cold storage at the end of January totaled 2.1 billion pounds, an increase of 25 percent from a year earlier. Nearly three-fourths of these stocks were in controlled atmosphere storage, up about 13 percent from a year earlier. As expected, stocks in the Pacific and Middle Atlantic States accounted for most of the increase, reflecting larger crops in those areas. As a result of the larger apple crop in the Pacific States, cold storage stocks, at 1.2 billion pounds, were up approximately 14 percent from a year ago. Most of the cold storage holdings of apples are in Washington which had approximately 1.1 billion pounds, up from 0.9 billion pounds last year.

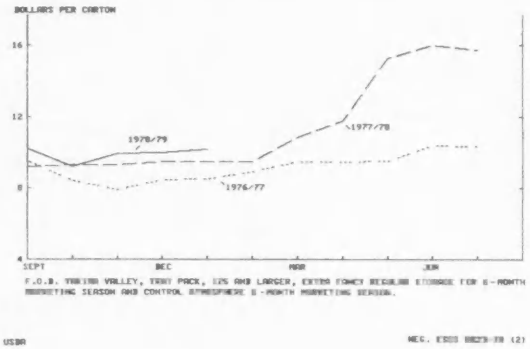
Market Outlook

Although the 1978 apple crop was substantially larger, fresh apple movement through early February was running about the same as last year. Apple shipments from the East and Midwest were running ahead of the 1977/78 pace, but shipments from Washington lagged a year earlier.

Larger shipments from the Eastern States have been reflected in slightly lower f.o.b. shipping point prices in the East, particularly for eastern varieties. However, f.o.b. prices for Red and Golden Delicious apples have been above a year ago. In February, the average price received by growers for all apples for fresh use was 14.0 cents per pound, compared with 13.2 cents in February 1978. Prices have remained high despite the larger crop and large cold storage holdings because of very strong demand in the processing market.

RED DELICIOUS APPLE PRICES
MONTHLY AVERAGES, WASHINGTON STATE



Despite larger remaining supplies of apples, both grower and retail prices are not expected to decline appreciably. The U.S. season average price to growers for the 1978 apple crop was estimated at 10.8 cents per pound, about 3 percent higher than in 1977. Total value of the U.S. commercial crop is estimated at $815 million, compared with nearly $700 million in 1977.

Exports Down

During July-December 1978, total exports of fresh apples amounted to 183 million pounds, down moderately from a year earlier. There were sharp reductions in exports to most of the European Community (EC) countries as their crops returned to normal levels. Larger exports to Canada, Hong Kong, Japan, and other countries, particularly the Middle East—which became an important customer last year—could not make up the difference.

During calendar year 1978, imports of fresh apples totaled about 132 million pounds, up from 109 million pounds a year earlier. Substantial boosts in imports from all of our major suppliers were responsible. Imports from Canada—our major supplier—were 5 percent larger than a year earlier.

Avocados

The 1977/78 avocado crop in California totaled 107 thousand tons, down 11 percent from the 1976/77 crop. Florida's crop at 10.7 thousand tons was about half as large as a year earlier. The total crop in 1977/78 was 17 percent smaller than the 1976/77 record of 141.1 thousand tons.

As a result of the smaller crop, the U.S. average price per ton received by growers for avocados for all uses rose to $735, up from $566 a year earlier. California prices averaged $740 per ton, while Florida growers received $690. At $79 million, California's production accounted for 91 percent of the value of the total U.S. crop.

For the 1978/79 season, the California forecast of shipments calls for 158 thousand tons, up by 47 percent from the 1977/78 harvest when 107 thousand tons were shipped. The new forecast is for the largest avocado crop ever in California, with the greatest increase being in the Hass variety. Florida certified shipments for the 1978/79 season are placed at 22.5 thousand tons. This will be more than twice the volume from the 1977/78 crop when only 10.3 thousand tons were shipped following the mid-January freeze in 1977.

Canada and Japan are the leading customers for U.S. avocados, usually accounting for 2-3 percent of total U.S. production. During calendar year 1978, U.S. exports of avocados totaled 6,641 tons.

Bananas

U.S. imports of bananas during 1978 totaled more than 2.2 million metric tons, a substantial increase over 1977. Honduras once again became our leading supplier, and Ecuador was second. Costa Rica, our leading supplier for the past 3 years, but plagued by strikes and tropical winds in 1978, slipped to third place. Those three countries supply more than two-thirds of our total banana supplies.

The index of average retail prices for all urban consumers (BLS) for bananas in January 1979 stood at 179.2 (1967=100), down from 209.1 in April, but 10 percent above a year earlier.

The wholesale price per 40-pound box of bananas averaged a record high $5.20 in 1978. Prices peaked in the spring of 1978, reaching $6.60 in April. The January 1979 wholesale price stood at $4.98—the highest January price on record—

Table 9—U.S. fresh banana imports by country of origin, calendar years, 1975-78

Country	1975	1976	1977	1978
	1,000 metric tons			
Colombia	142.1	111.3	105.5	174.7
Costa Rica	631.0	695.6	556.0	485.1
Ecuador	430.7	396.3	441.3	516.6
Guatemala	204.6	234.3	214.7	169.8
Honduras	262.6	485.4	512.1	540.6

Panama	108.6	57.1	142.7	188.4
Other	9.6	11.9	40.4	35.6
Total	1,910.4	2,103.0	2,116.8	2,237.6

Source: Bureau of the Census, U.S. Department of Commerce.

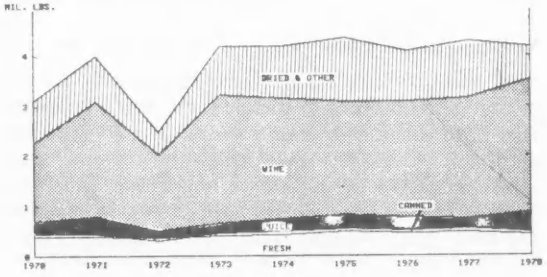
and, if the usual seasonal pattern prevails, consumers can look for higher banana prices this spring. Banana prices usually moderate when domestic fruit supplies come on the market in early summer.

Grapes

The 1978 utilized grape crop totaled 4.2 million tons, 3 percent less than last year but 2 percent more than the rain-damaged 1976 crop. The 1978 total utilization was less than last year because 55 thousand tons (248 thousand tons fresh equivalent) of raisins were lost due to severe damage from September rains in California. Before the rains, the total U.S. grape crop was forecast at a record 4.6 million tons.

The California total grape crop of 3.9 million tons was only slightly less than the previous year's record, and took 88 percent of the U.S. total. Declines in the utilized production of raisin and table varieties—down 19 and 25 percent, respectively—were offset by increases in the production of wine varieties—up 9 percent. In fact, production of wine varieties increased to another new record of 1.7 million tons.

U.S. GRAPES: UTILIZATION



USDA

Grape production in other States rebounded to 550 thousand tons after very small crops in nearly all of the major grape-producing States in 1977. New York and Washington are the leading grape-producing States outside of California, and the Concord grape (used for juice, jams, jellies, and wines) is the leading variety in those States.

For the United States as a whole, more than half of the total grape crop is usually crushed for wine. In 1978, 63 percent of the utilized production was crushed. In California this year, 96 percent of the wine varieties was crushed, as well as 51 percent of the table varieties, and 44 percent of the raisin varieties.

About 2.5 million tons of grapes were crushed for wine in California in 1978, up moderately from 1977. Total shipments of wine from California during the first 11 months of 1978 reached 273.2 million gallons, up moderately from the corresponding period a year earlier and continuing the upward trend in wine shipments.

Grower Prices Up

The 1978 average grower price for grapes for all uses was estimated at $239 per ton, up from $194 in 1977 and $155 in 1976. As usual, prices varied widely among producing areas, among varieties, and by end uses. Arizona growers received $943 per ton for grapes (primarily for fresh market) while California growers received about $552 for their table varieties for fresh use. New York growers received an average of $245 per ton.

Fresh grape shipments from California through early February this season totaled 541.7 million pounds, down slightly from a year earlier. In early February, shipping point prices for Emperors, f.o.b. central San Joaquin Valley, California, were reported at $7.25 per 23-pound lug, compared with $6.38 a year earlier. Fresh prices are expected to remain substantially above last year's level for the remainder of the season. January 31 stocks, mostly Emperors, totaled 9.1 million pounds, down 34 percent from stocks at the same date a year earlier.

Pears

Crop Down

The U.S. pear crop totaled 727 thousand tons in 1978, down 7 percent from last year, and 11 percent below the 1976 record. All of the crop was utilized. The Pacific Coast States accounted for 684 thousand tons, or 94 percent of the total U.S. utilized crop. California and Oregon were responsible for the decrease. Washington's utilized production, at 246 thousand tons, was nearly 10 percent larger than a year earlier.

Utilized production of Bartletts in the Pacific Coast States totaled 469 thousand tons in 1978, 14

Table 10—Pears: Utilized production by States and Pacific Coast, variety composition, 1976, 1977, and 1978

State	1976	1977	1978	Pacific Coast	1976	1977	1978

California	353,500	334,600	288,200	3 States:			
				Bartlett	560,000	543,000	468,500
				Other	227,500	194,600	215,700
United States	820,600	784,500	727,200	Total	787,500	737,600	684,200

[1] Estimates discontinued after 1977 crop.

Source: Noncitrus Fruit and Nuts Annual, CRB, ESCS.

percent below the 1977 level. Utilized production of other-than-Bartlett varieties, at 216 thousand tons, was 11 percent larger than the 1977 total and accounted for 30 percent of the U.S. pear crop, up from 25 percent a year earlier.

Processing use accounted for nearly 59 percent of the pear crop, compared with 61 percent in 1977. The slight decrease in processing use is attributable to the smaller Bartlett crop, higher prices in the fresh market, and a larger proportion of other-than-Bartlett pears processed. Bartletts accounted for about 88 percent of the total processed pears in 1978 and about 32 percent of the pears sold fresh.

Stocks Larger

The larger harvest of winter pears in the Pacific Coast last fall has resulted in sharply larger stocks in cold storage. The combined production of pears other than Bartlett in Oregon and Washington was placed at 209 thousand tons, 12 percent larger than in 1977. Cold storage stocks of other-than-Bartlett pears—mostly D'Anjou and Bosc—at the beginning of February amounted to 134 thousand tons, 25 percent larger than a year earlier.

Despite larger supplies, f.o.b. prices for U.S. No. 1 D'Anjou pears at Yakima, Washington, have been running above year-earlier levels. In mid February, f.o.b. prices were quoted at $10.05 per box (90-135's) compared with $9.00 per box a year ago, when stocks were much smaller. Even at the higher prices, demand for fresh pears appears to be stronger this season. Through mid-February, fresh pear unloads in 41 major markets were running slightly ahead of last year's pace.

Even with larger cold storage holdings, prices are expected to continue well above year-earlier levels for the balance of the season. The U.S. season average price to growers for the fresh pear crop has been estimated at $261 per ton, compared with $194 in 1977. Average grower prices for pears for processing use (except dried) are estimated at $185 per ton in 1978, compared with $115 in 1977. Average prices for Bartlett pears from Pacific Coast States are also estimated sharply above a year earlier. Bartlett pear prices, by uses, and percentage changes from 1977 are: fresh, $278 per ton, up 87 percent; canned, $203 per ton, up 59 percent; (other processed (except dried)), $194 per ton, up 62 percent; and (all uses), $213 per ton, up 68 percent.

Foreign Trade Good

U.S. exports of fresh pears during July-December 1978 totaled 24,251 metric tons, about 2 percent less than during the same period in 1977. Smaller shipments to the EC and Latin America more than offset increases in shipments to Sweden and Hong Kong. Canada is by far the largest single customer for fresh pears, taking more than one-third of our total exports.

Due to strong demand and high prices, imports of fresh pears were more than a third larger during

1978 than during 1977. Australia is our major supplier, shipping 3,188 metric tons, more than half of our imports. Chile, with 1,646 metric tons, is the second most important supplier. South Africa shipped us 668 metric tons in 1978.

Strawberries

Crop Down in 1978

Despite the larger harvested acreage, U.S. commercial strawberry production during 1978 totaled only 648 million pounds, slightly smaller than the year before when acreage was 6 percent smaller. Yields dipped to 17,800 pounds per acre, down from 19,000 pounds in 1977.

The California strawberry crop, at 514 million pounds, was slightly less than in 1977, despite increased acreage. Yields in California dipped to 37,500 pounds per acre due to adverse weather conditions during part of the peak production season. California's share of the U.S. crop dipped to 79 percent, down from 80 percent in 1977. Production in the other principal strawberry-producing States was spotty, depending upon weather conditions in each particular area.

Because of higher prices in the fresh market than in the processing market, a larger portion of the total production was sold fresh. The average value for Florida strawberries in 1978 was $57.40 per hundredweight (cwt.), up from $41.10 in 1977. Prices for fresh market strawberries averaged lower in other areas of the country, down to an average of $35.80 compared with $38.90 the year before. But prices for processing strawberries fell to $18.80 per hundredweight, 16 percent below a year earlier, thus making the fresh market relatively more attractive to growers.

The 1979 Florida strawberry acreage is placed at 2,300 acres, 15 percent larger than in 1978. Current indications are that the 1979 Florida crop is in good condition, and is making rapid growth in the Plant City area. Harvest is underway in some areas. Florida's winter crop normally accounts for less than 5 percent of U.S. annual production. So far this season, shipments to 41 major markets are running substantially ahead of last year's pace. Opening f.o.b. prices for Florida strawberries at $6.75 per 12-pint flat were slightly lower than last year. Prices probably will decline with increased supplies from Florida and Mexico.

Imports Up Slightly

The following table shows data on U.S. imports of fresh and frozen strawberries for the past 5 years. Most imports for both items originate in Mexico. Adverse weather seriously restricted the strawberry crop in Mexico in 1976, causing curtailment of both fresh and processed imports. Imports have rebounded during the past 2 years to 33.7 million pounds fresh and 97.6 million pounds frozen, but are still well below the high import levels of 1973 and 1974.

Table 11—U.S. strawberry imports

January-December	Fresh	Frozen
	Million pounds	
1973	38.9	113.7
1974	43.7	117.1
1975	31.2	97.5
1976	21.6	49.6
1977	24.7	97.0
1978	33.7	97.6

PROCESSED NONCITRUS

Smaller crops of most noncitrus crops in California last summer led to smaller packs of fruit in 1978/79. The smaller packs, plus a smaller than usual carryin, resulted in the smallest supplies of canned noncitrus fruit in the past 5 years. Shipments of canned noncitrus fruit through December were also smaller than usual. January 1 stocks were substantially smaller this year. Current stocks of dried fruits—particularly raisins and prunes—were also sharply smaller as a result of heavy rains during the September drying season in California. Cold storage holdings of frozen fruits and berries were also substantially lower than a year ago. The net result is a tight supply situation for nearly all processed noncitrus fruit items which will continue at least until the new packing season gets underway next summer.

Reflecting the smaller supply situation, prices for all processed fruit items are above last year's levels.

Canned

Although the packing season is not completed for apple and pineapple products, data available for 11 principal canned fruit items indicate that the 1978/79 U.S. pack of canned noncitrus fruit will be substantially smaller than the 1977/78 pack.

Smaller packs are reported for all of the 11 fruit items reported in table 29. The canning season for pineapple is still in progress, but carryin at the beginning of the season was a fifth larger, and total supplies in December were 7 percent smaller than a year earlier. In addition, shortages in canning supplies and strong demand are expected to push prices for canned pineapple above current levels this spring. The pack of canned applesauce is expected to exceed last year's total.

Supplies Down Substantially

Total supplies of canned fruit for the 1978/79 season are substantially below those of a year ago as a result of a 9-percent smaller carryin and an 18-percent smaller pack. Overall shipments of canned fruit through December 1 were running generally behind shipments of a year earlier. Thus, stocks at the beginning of the year were 20 percent smaller than a year ago.

Supplies of canned cling peaches available for the remainder of the season are sharply lower than last year because of the small crop of clingstone peaches in California last summer. Movement of canned clingstones, while trailing last year's pace, has been about average. The inventory of canned tart cherries remains very tight this year because of a small carryin and good demand from the food processing trade. Stocks of canned sweet cherries are smaller this year than during the past 4 years, because a 7-percent increase in shipments further depleted slightly smaller beginning stocks. Canned apricot stocks are also sharply lower as a result of the small apricot crop in California last year, and a small carryover. Lower stocks were also registered for canned fruit cocktail, spiced cling and freestone peaches, pears, and purple plums. Only stocks of mixed fruits and fruits for salad showed gains over a year earlier, and these were minimal.

F.o.b. prices for the individual canned fruits have generally reflected the supply situation. The BLS wholesale price for canned clingstone peaches in January stood at $6.45 per case (12-2½ cans), 19 percent above the January 1978 level. The January 1979 BLS wholesale price index for all canned fruits was 209.3 (1967=100), 14 percent above 1978. Prices for all canned items are expected to remain substantially above last year's level, at least until the new packing season gets underway next summer. Even then, a new cannery workers' contract in 1979 and the general inflationary trend will counteract any price declines resulting from larger fruit crops expected in California next summer.

Exports Up Substantially

Led by substantial increases in exports of canned cling peaches, and tart cherries, U.S. exports of canned fruits during June-December 1978 averaged substantially above those of a year earlier. Sharply stronger demand from Europe and Latin America was responsible for the increases. The outlook for exports of canned fruit during the remainder of the season will be affected by supplies from competing countries—particularly Australia and South Africa—and the value of the dollar in relation to foreign currencies.

Table 12—Stocks of frozen fruit: End of January 1976-79

Frozen fruit	1976	1977	1978	1979[1]
	Thousand pounds			
Apples	77,604	98,446	103,575	91,702
Apricots	10,357	11,608	11,420	8,743
Blackberries	12,763	11,014	7,585	7,666
Blueberries	21,383	23,214	21,802	32,297
Boysenberries	4,769	2,311	2,200	1,742
Cherries, tart (RSP)	[2]83,224	[2]42,262	44,917	48,919
Cherries, sweet			13,704	12,288
Grapes	6,008	6,910	7,465	8,012
Peaches	40,988	52,429	61,883	44,884

Raspberries, Black	2,065	1,491		
Strawberries	104,118	92,157	126,208	94,324
Other frozen fruits	141,082	144,970	136,457	118,088
Total frozen fruits	522,068	498,994	549,063	480,531

[1] Preliminary. [2] Includes both sweet and tart cherries. [3] Red and black raspberries.

Source: Cold Storage, CRB, ESCS.

Frozen

The supply of frozen noncitrus fruits and berries in cold storage on January 31 was down substantially from the same period a year ago. There were substantial declines in all items except blackberries, blueberries, raspberries, grapes, and tart cherries. There were major declines in stocks of frozen strawberries, apples, and 'other' fruit.

Strawberries are the major frozen fruit. Storage stocks on January 31 were down one fourth from a year ago, reflecting smaller domestic production. Imports of frozen strawberries—mostly from Mexico—were up 1 percent in calendar year 1978 over 1977. Reflecting the smaller supplies, January wholesale prices for frozen strawberries—at $5.23 per dozen 10-ounce packages—were 6 percent above a year earlier.

In contrast, stocks of frozen blueberries were up sharply, and stocks of other frozen bushberries were above last year's levels. However, because of the competition among frozen fruit items, and the degree of substitutability among them, prices are expected to remain high throughout this marketing season.

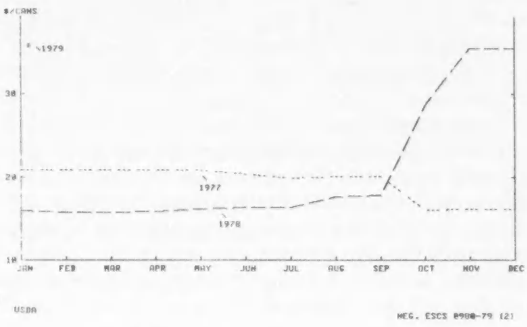
Dried Fruit

The production of dried fruit in the United States during 1978 was substantially smaller than in the previous year because of adverse weather in California during the peak drying season.

Deliveries of California raisins to handlers through February 10, 1979 totaled 79,027 tons, compared with 247,000 tons during the comparable period last season. An additional 60,021 tons of raisins were being held for reconditioning, and part of these will be delivered to handlers after damaged raisins have been removed. This small crop, coupled with a modest carryin of nearly 68 thousand tons, has resulted in very tight supplies and high raisin prices. Because of this situation, shipments through January 31 (August-January) were down an average of 15 percent. Domestic shipments were down 9 percent and exports trailed by 42 percent.

Because of the drastically smaller supplies, wholesale prices of raisins have skyrocketed since September. The BLS wholesale price of raisins in January was $35.52 per case (24-15-ounce cartons) compared with $15.92 per case last year and $17.82 in September 1978. The season average price received by growers is estimated at $1,121 per ton (dried basis), up from $840 a ton last year.

RAISINS: BLS WHOLESALE PRICE



Production of California dried prunes, estimated at 131,000 tons, is down 18 percent from the 1977 output. Thus, even with a larger carryin, total supplies of dried prunes are substantially smaller than last year. Reflecting the smaller supplies, the season average price to growers was estimated at $650 per ton, 30 percent higher than a year ago. With the smaller crop but higher price, the total value of prune production was placed at $85 million, up from $79 million in 1977.

With the smaller total supplies, prices for dried prunes have edged upward. The January 1979 BLS average wholesale price of dried prunes was $15.32 per case (24 one-pound packages), up from $11.79 in January 1978. Prices are expected to remain firm through the remainder of the season.

California fig production totaled 27,700 tons in 1978, down one-third from the 1977 crop. Approximately 87 percent of the fig crop was dried (24,000 tons fresh-weight basis) and the remainder was used fresh or was canned. Reflecting the smaller crop, grower prices for figs for all uses were estimated at $308 per ton, up from $267 a year earlier. The total value of the U.S. fig crop was placed at $8.5 million.

TREE NUTS

The estimated production of six major domestic tree nuts in 1978, at 430 thousand tons, was down one-fourth from the 1977 crop as smaller crops of almonds, walnuts, pecans, and pistachios more than offset the larger crops of filberts and Macadamia nuts. The drought in 1977, a mild winter, and a cold damp spring were responsible for the smaller crops of almonds, walnuts, and pistachios in California. The smaller pecan crop in most southern States was due to poor growing conditions last summer.

Tree nuts are substitutable for each other in many end uses. Because of this, prices for one kind of nut are strongly influenced by the supplies and

prices of the others. Thus, with sharply smaller crops of almonds and walnuts, and substantially smaller supplies of pecans, prices for all domestic tree nuts are at or near record high levels. The value of utilized production is estimated at $621 million, up 12 percent from 1977.

Almonds

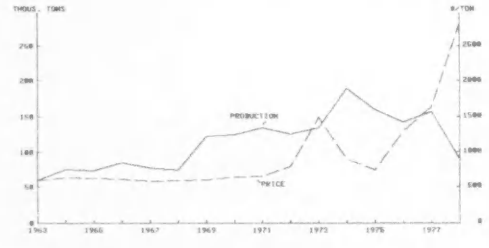
The 1978 almond crop in California totaled 180 million pounds of nutmeats (142 thousand tons or 81.6 thousand metric tons in-shell basis). This was 42 percent less than was produced in 1977. The decrease was due entirely to sharply lower yields. In 1978, the yield per bearing acre was 600 pounds (kernel weight), the lowest in the last 15 years. Even with the substantially larger inventory at the beginning of the season, total supplies of salable almonds for the current marketing season are 28 percent smaller than last season. Despite sharply higher prices, demand for almonds is relatively good. Shipments to both domestic and foreign markets during the first 7 months of the crop year (July-January) were only 4 percent below last season's levels.

According to the Almond Board of California, total shipments of almonds during July-January 1979 amounted to 156.6 million pounds (shelled basis), compared with 163.4 million pounds during the corresponding period a year ago. The smaller shipments were mainly attributed to reduced exports. West Germany is our largest export market. Sales to Japan continue strong. Our export prospects to Europe do not appear bright as Spain, the world's second largest producer, reported the 1978 almond crop approximately 87 percent larger than the 1977 freeze-damaged crop. On the other hand, the devaluation of the U.S. dollar—which causes higher export prices of Spanish almonds—appears to have dampened the enthusiasm of Spanish traders with respect to exports. With the dollar still relatively weak against the Japanese yen, prospects appear favorable for further expansion of the export market for our almonds in Japan during 1978/79. India has liberalized its import policy for U.S. almonds. Our almond exports to India so far this season have increased 37 percent from year-earlier levels.

If the almond sales continue at the current pace, carryout at the end of the season is likely to be the smallest in several years. However, large crops in 1979 may be expected as almond trees have benefitted from cold weather this winter in California.

In response to the sharply smaller crop and smaller supplies of other competing tree nuts, the 1978 season average grower price for almonds advanced sharply to $1.40 a pound, compared with $0.82 in 1977. Consequently, even with a sharply smaller crop, total value of the almond crop amounted to $252 million, nearly the same as 1977.

U.S. ALMOND PRODUCTION & PRICES RECEIVED BY GROWERS



USDA

NEG. ESCS 973-79 (2)

Pecans

The U.S. pecan crop is estimated at 205 million pounds (93.1 thousand metric tons), 13 percent less than was harvested in 1977. Improved varieties, at 142 million pounds, accounted for 69 percent of the crop, compared with 58 percent in 1977. The native and seedling crop is placed at 63.2 million pounds, 36 percent less than the 1977 crop. Because of substantially higher prices, movement has weakened considerably. Consequently, cold storage holdings of in-shell pecans as of January 31 were 28 percent above year-earlier levels. Shelled pecans in cold storage, although a small quantity, were 57 percent larger.

Because of the smaller crop and smaller supplies of competing tree nuts, the 1978 season average price received by pecan growers was estimated at 66.6 cents per pound, up 15 percent from year-earlier levels. Higher prices were reported for both improved varieties and seedlings. However, total value of the pecan crop declined 7 percent from 1977.

Walnuts

The walnut crop in California totaled 160 thousand tons (145 thousand metric tons), 17 percent less than was produced in 1977. The smaller walnut crop combined with a smaller carryover at the beginning of the season resulted in the total supply being substantially less than in the 1977/78 season.

As a result of sharply higher prices, shipments of both shelled and in-shell walnuts during the first 6 months of 1978/79 (August 1-January 31) were considerably below year-earlier levels. During the period, 102 million pounds of in-shell and 56 million pounds of shelled walnuts were shipped. Of these, about 51 million pounds of in-shell, and 3 million pounds of shelled walnuts were exported,

according to the Walnut Marketing Board. Japan, West Germany, Israel, Canada, and England are our major export customers, but their purchases showed mixed changes from 1977/78. Substantial decreases in purchases were recorded for West Germany, Israel, and Canada, but Japan and England bought more. Our walnut sales abroad, particularly in Europe, will face greater competition from substantially larger crops in France and Italy.

Even with considerably smaller shipments so far this season, the carryout at the end of the season is not likely to be large. The 1978 season-average grower price is tentatively estimated at $1,360 per ton (in-shell), compared with $731 for the 1977 crop.

Other Tree Nuts

The 1978 filbert production in Washington and Oregon totaled 13.4 thousand tons (12.2 thousand metric tons), 14 percent above last season and 87 percent more than in 1976. Because of the smaller supply of other tree nuts, U.S. season average prices received by growers is expected to average $800 per ton, up from $687 for the 1977 crop.

The 1978 Hawaiian Macadamia crop, at 22 million pounds (9,980 metric tons), was 12 percent above the 1977 crop and was 16 percent above 1976. Despite a larger crop, prices received by growers are estimated at 48.7 cents per pound, compared with 40.8 cents a year earlier.

Pistachio production in California in 1978 was placed at 2.5 million pounds (1,130 metric tons), 44 percent less than the 1977 production. However, the pistachio production trend is upward as more trees reach bearing age. As a result of the sharply smaller crop, grower returns averaged $1.24 per pound, up from $1.04 in 1977.

GEOGRAPHIC DISTRIBUTION OF FRUIT AND NUT PRODUCTION AND VALUE

The utilized production and value of fruits, berries, and tree nuts grown in the United States in 1977 and 1978 (preliminary) are shown by States in tables 13-17 of this issue.

Utilized production of fruits, berries, and nuts declined slightly from 1977 to 26.6 million tons in 1978, but, reflecting higher farm prices, the total value of production jumped nearly 20 percent to $5.3 billion. Citrus production accounted for 54 percent of the fruit tonnage harvested but only about 30 percent of the total value of all fruits and nuts. Leading crops in order of tonnages were oranges, 9.5 million tons; grapes, 4.2 million tons; apples, 3.8 million tons; grapefruit, 3.0 million tons; and peaches, 1.3 million tons. Ranked by value, the leading crops are oranges, $1.2 billion; grapes, $998 million; apples, $815 million; peaches, $309 million; almonds, $252 million; walnuts, $218 million; and strawberries, $200 million.

California and Florida accounted for nearly three-quarters of the U.S. fruit and nut tonnage utilized and about two-thirds of the total value. California was the leading State in 1978, accounting for 45 percent of the total value of all fruits and tree nuts produced. Florida was second with 22 percent. Other major producers were Washington, 9 percent; Michigan, 3.5 percent; and New York, 3.0 percent.

Edible tree nut production, at 430 thousand tons, was sharply below the 1977 level because of smaller crops of almonds and walnuts in California. California usually accounts for about three-fourths of both the total tonnage and value of the U.S. tree nut crop.

Revised data for 1978 will be published in the March 1980 *Fruit Situation*, along with preliminary data for 1979.

[1] Preliminary. [2] 1976 indicates 1975/76. [3] Production for clingstone peaches includes culls and cannery diversions but excluded in value. [4] Due to rounding, totals are not identical in tables 13, 15, and 17. [5] Excludes K-early citrus fruit. [6] Estimates beginning 1977. [7] Data not available until July 5, 1979. [8] Estimates discontinued after 1977 crop. [9] Production converted to in-shell equivalent tons, using industry shelling ratios. Value on shelled basis. [10] Production includes New Mexico, but excluded in value.

[1] For all items except bananas and California—apricots, dates, persimmons, plums, and prunes, some quantities canned, frozen, or otherwise processed are included in other utilization categories to avoid disclosure of individual operations. [2] Some totals do not add due to rounding. [3] Tart cherries, juice, wine, and brined; sweet cherries, frozen, juice, etc.,; and olives, chopped, minced, brined and other cures. [4] Includes canned figs. [5] Mostly canned, includes small quantities dried other uses not published by States to avoid disclosure of individual operations. [6] Michigan, Idaho, Oregon, and Washington.

[1] Preliminary. [2] Fresh fruit prices are equivalent returns at packinghouse door for Washington and Oregon, first delivery point for California, and at point of first sale in all other States. Processing fruit prices for all States are equivalent returns at processing plant door. [3] Dollars per ton. [4] Data available July 5, 1979. [5] 1977 indicates 1977/78. [6] Includes youngberries. [7] Excludes dried pears. [8] Equivalent packinghouse door—1977 indicates 1976/77. [9] Estimates discontinued after 1977 crop. [10] Estimates beginning 1977.

[1] Prices are basis bulk fruit at first delivery point for all California fruits except prunes and pears for drying and processed grapes. Prices for California prunes and pears for drying and grapes and for fruits in other States are equivalent processing plant door returns. [2] Not published to avoid disclosing individual operations. [3] All grape varieties used for processing and wine; raisin varieties for dried (fresh basis).
